Write a Python program that takes a list of integers, removes all duplicate values, and stores the unique elements in a tuple. Then, convert the tuple into a dictionary where the keys are the elements and the values are the cube of the elements.

CODE:

```
numbers = [2, 4, 6, 2, 8, 4, 10, 6]
unique_tuple = tuple(set(numbers))
cube_dict = {num: num**3 for num in unique_tuple}

print("Original list:", numbers)
print("Unique elements as tuple:", unique_tuple)
print("Dictionary (element : cube):", cube_dict)
```

OUTPUT:
